14. Solar Crown

Supernova Cup · upgrade blueprint · src/kart/tracks/solar.ts

Where it is now

3.1 km orbital station over a gas giant: boosted leap, spire glide or solar array, docking-arm jump or glass tube. Lap 2 flare; last lap debris.

What is wrong

The new look works, but it drives like Sky Islands.

Core mechanic

Gravity. Gravity sticks to the track: you drive up walls, upside down round the station's rings and through loops.

Signature moments

- A full loop round a ring.
- A corkscrew round the crown.
- Gravity switches: flip onto the underside of the track and race upside down.

Layout changes

- Rebuild sections as loops, a corkscrew and an underside run.
- Keep the station look, the planet and the sun.

Lap changes

- Lap 2: solar flare.
- Last lap: gravity flickers and you briefly float off the road.

Engine work needed

- Full 3D driving: the car's up follows the road (loops, walls, upside down).
- Camera that follows the road's up.

Rivals

- Rivals follow the 3D track the same way.

Done when

- Laps of 50-60 s for a good driver; all 3-lap test races finish with no errors.
- Rivals use every route and the core mechanic, with no more than 2 rival falls per race.
- The core mechanic is in play for at least half the lap, not just one set piece.
- A blind test: a screenshot or a 10-second clip of this track could not be mistaken for any other track.
- Item rows are never on the start line; nothing solid blocks a road by accident.
